FOREWORD

This report documents the status of application of innovative treatment technologies in the Superfund program. It presents information on some, but not all, projects applying innovative treatment technologies at non-Superfund sites such as those subject to corrective action under the Resource Conservation and Recovery Act (RCRA) and those being addressed by the Department of Defense (DoD), and the Department of Energy (DOE). We have expanded the report to include many new innovative projects selected by the EPA in fiscal year 1994 and numerous graphics and tables to assist the reader in understanding the data.

We are pleased to announce a new, software version of the report, called the *Innovative Treatment Technologies Annual Status Report Database (ITT Database)*, which is a Windows™-based system that contains all of the site-specific information that previously was presented in tabular form. Information provided about each site includes site type, technology selected or used, target contaminants, contaminated matrix, project status, and site contact names and telephone numbers. Additional information about completed projects includes periods of operation, typical pre- and post-treatment concentrations of key contaminants treated, cleanup goals, operating parameters (such as retention time and additives), materials handling required, and management of residuals. The database is searchable and can generate statistics and reports tailored to the user's specifications. Ordering information for the database and the hard-copy report is on the preceding page.

We intend this information to improve communication between experienced technology users and those who are considering innovative technologies to clean up contaminated sites, as well as enable technology vendors to evaluate the market for possible application of innovative treatment technologies at Superfund sites and other contaminated sites for the next several years.

Our goal with this report is to increase the application of new, less costly, and more effective technologies to address the problems at Superfund sites as well as other contaminated sites.

Walter W. Kovalick, Jr., Ph.D.
Director, Technology Innovation Office

ACKNOWLEDGEMENTS

This document was prepared under the direction of Ms. Linda Fiedler, work assignment manager for the EPA's Technology Innovation Office (TIO).

Special acknowledgement is due the Federal and state staff and other remediation professionals

listed as contacts for individual sites. They provided the detailed information in this document. Their cooperation and willingness to share their expertise on innovative treatment technologies encourages the application of those technologies at other sites.

ABSTRACT

This yearly report documents and analyzes the selection and use of innovative treatment technologies in the EPA Superfund Program and at some non-Superfund sites subject to corrective action under the RCRA Program, and those being addressed by DoD, and DOE. The report updates the status of all the projects and includes projects for which innovative technologies were selected in Superfund Records of Decision (ROD) signed during fiscal year 1994. The information will improve communication between experienced technology users and those who are considering innovative technologies to clean up contaminated sites. In addition, the information will enable technology vendors to evaluate the market for innovative technologies at Superfund sites for the next several years.

Alternative treatment technologies are alternatives to land disposal. Innovative treatment technologies are alternative treatment technologies the use of which at Superfund and similar sites is inhibited by lack of data on cost and performance. This report documents the use of the following innovative treatment technologies to treat ground water (in situ), soils, sediments, sludge, and solid-matrix wastes:

Soil Technologies

- Bioremediation (ex situ)
- Bioremediation (in situ)
- Contained Recovery of Oily Wastes (CROW™)
- Cyanide oxidation
- Dechlorination
- In situ flushing
- In situ vitrification
- Plasma high temperature metals recovery
- Phyto-treatment
- Soil vapor extraction
- Soil washing
- Solvent extraction
- Thermal desorption

Groundwater Technologies

- Air sparging
- Bioremediation (in situ)
- Dual-phase extraction
- In situ oxidation
- Passive treatment walls
- Surfactant flushing

This document includes a list of sites and analysis of 332 applications of innovative treatment technologies for remedial actions, 29 applications for removal actions, 8 applications under RCRA corrective actions, and 28 applications under other federal programs. The analysis includes the number of applications by technology, types of contaminants treated, quantities of soil treated, and status of the project. The information for these sections was collected through analyses of RODs; review of 50 RCRA corrective action statements of basis (SB); review of EPA's Office of Solid Waste and Emergency Response (OSWER) tracking systems; and interviews with EPA regional staff, as well as with DoD and DOE staff.

OVERVIEW

Introduction

The Technology Innovation Office (TIO) of the U.S. Environmental Protection Agency's (EPA) Office of Solid Waste and Emergency Response (OSWER) has prepared this *Innovative Treatment Technologies: Annual Status Report, Seventh Edition*, to document the use of innovative treatment technologies to remediate contaminated hazardous waste sites. The report contains a list and an analysis of Superfund sites (both remedial and removal actions), Resource Conservation and Recovery Act (RCRA) corrective action sites, and other non-Superfund sites (that is, sites addressed under other federal programs) at which innovative treatment technologies are being used. Site managers can use this report to evaluate cleanup alternatives for similar sites. Innovative technology vendors can use it to identify potential markets. TIO also uses the information to track progress in the application of innovative treatment technologies.

The report is updated annually. This September 1995 issue of the report updates and expands information provided in the September 1994 report. Information added to this update includes 42 innovative treatment technologies selected for remedial actions in fiscal year (FY) 1994 Superfund records of decision (RODs)—a ROD is the decision document used to specify the way a site, or part of a site, will be remediated. In addition, 15 additional projects have been completed since the last edition of this report. Also added to this report is information about eight innovative technologies selected in statements of basis (SBs) for implementation at RCRA corrective action sites.

This report does not address sites that use non-treatment remedies, such as landfilling and capping. It contains only minimal information about sites that use incineration, solidification and stabilization, or pump-and-treat remedies. More information about RODs that specify such remedies is presented in the series of ROD annual reports published by the Office of Emergency and Remedial Response (OERR). For more information about those reports, call the Superfund Hotline at (800) 424-9346 (outside the local calling area) or (703) 412-9810 (inside the local calling area).

Sources of Information for this Report

EPA initially used RODs for individual sites to compile information on remedial action, and pollution reports, on-scene coordinators' reports, and the OSWER Removal Tracking System to compile data on emergency response actions. The U.S. Army Corps of Engineers (USACE) Hazardous, Toxic, and Radioactive Waste (HTRW) Mandatory Center of Expertise in Omaha, Nebraska; *Synopses of Federal Demonstrations of Innovative Site Remediation Technologies, Third Edition* (EPA-542-B-93-009); and RCRA corrective action SBs were consulted to compile information on projects under other federal programs. EPA then verified and updated the draft information through interviews with remedial project managers (RPM), on-scene coordinators (OSC), and other contacts for each site.

The data on project status supplements data in the Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS), EPA's Superfund tracking system, by providing more detailed information on the specific portion of the remedy that involves an innovative technology. In addition, information about technologies and sites identified here might differ from information found in the ROD annual reports and the RODs database. Such differences are the result of changes in the remedy during the design phase of the project. The changes may or may not have required official documentation (that is, a ROD amendment or an explanation of significant differences [ESD]).

What are Established and Innovative Treatment Technologies?

Treatment technologies are alternatives to land disposal. Established treatment technologies are those for which cost and performance information is readily available. The most frequently used established technologies are incineration, solidification and stabilization, and pump-and-treat technologies for groundwater. Treatment of groundwater after it has been pumped to the surface often resembles traditional water treatment; therefore, in general, pump-and-treat groundwater remedies are considered established technologies.

OVERVIEW

Innovative treatment technologies are alternative treatment technologies for which routine use at Superfund and similar sites is inhibited by lack of data on performance and cost. In general, a treatment technology is considered innovative if it has had limited full-scale application. Often, it is the application of a technology or process to soils, sediments, sludge, and solid-matrix waste (such as mining slag) or groundwater that is innovative. This report documents the use of the following innovative treatment technologies to treat groundwater, soils, sediments, sludge, and solid-matrix waste:

Soil Technologies

- Bioremediation (ex situ)
- Bioremediation (in situ)
- Contained Recovery of Oily Wastes (CROW™)
- Cyanide oxidation
- Dechlorination
- In situ flushing
- In situ vitrification
- Plasma high temperature metals recovery
- Phyto-treatment
- Soil vapor extraction
- Soil washing
- Solvent extraction
- Thermal desorption

Groundwater Technologies

- Air sparging
- Bioremediation (in situ)
- Dual-phase extraction
- In situ oxidation
- Passive treatment walls
- Surfactant flushing

Over the past several years, a number of remedial technologies that are considered innovative have seen increased use at Superfund and other contaminated sites. In particular, an increasing number of soil vapor extraction and thermal desorption projects have been completed. Although those technologies have become accepted more generally, because the results of most of the projects are not widely known, this report will continue to track soil vapor extraction and thermal desorption as innovative technologies.

Definitions of Specific Innovative Treatment Technologies

This document reports on the use of the innovative remediation technologies listed above and, to a lesser extent, on the use of established technologies. The technologies reported in the following sections treat contaminants in very differ-

ent ways. This section provides brief definitions of the 13 types of source control (primarily soil) innovative technologies and six types of innovative in situ groundwater technologies as they are used in this document.

Source Control Technologies

EX SITU BIOREMEDIATION uses microorganisms to degrade organic contaminants in excavated soil, sludge, and solids. The microorganisms break down the contaminants by using them as a food source. The end products typically are CO₂ and H₂O. Ex situ bioremediation includes slurry-phase bioremediation, in which the soils are mixed in water to form a slurry, and solid-phase bioremediation, in which the soils are placed in a cell or building and tilled with added water and nutrients. Land farming and composting are types of solid-phase bioremediation.

In applications of IN SITU SOIL BIOREMEDIATION, an oxygen source and sometimes nutrients are pumped under pressure into the soil through wells, or they are spread on the surface for infiltration to the contaminated material. Bioventing is a common form of in situ bioremediation.

The CONTAINED RECOVERY OF OILY WASTES (CROW™) process displaces oily wastes with steam and hot water. The contaminated oils are swept into a more permeable area and are pumped out of the soil.

In CYANIDE OXIDATION organic cyanides are oxidized to less hazardous compounds through chemical reactions.

DECHLORINATION results in the removal or replacement of chlorine atoms bonded to hazardous compounds.

For IN SITU FLUSHING, large volumes of water, at times supplemented with treatment compounds, are introduced into soil, waste, or groundwater to flush hazardous contaminants from a site. Injected water must be isolated effectively within the aquifer and recovered.

IN SITU VITRIFICATION treats contaminated soil in place at temperatures of approximately 3000°F (1600°C). Metals are encapsulated in the glass-like structure of the melted silicate compounds. Organics may be treated by combustion.

PLASMA HIGH TEMPERATURE METALS RECOVERY is a thermal treatment process that purges contaminants from solids and soils as metal fumes and organic vapors. The organic

OVERVIEW

vapors can be burned as fuel and the metal fumes can be recovered and recycled.

PHYTO-TREATMENT involves the cultivation of specialized plants that are capable of taking up specific soil contaminants into their roots or foliage. Uptake of contaminants by the plants reduces concentrations of contaminants in the soil. Periodic harvesting of the plants may be necessary.

SOIL VAPOR EXTRACTION (SVE) removes volatile organic constituents from the soil in situ through the use of vapor extraction wells, sometimes combined with air injection wells, to strip and flush the contaminants into the air stream for further treatment.

SOIL WASHING is used for two purposes. First, the mechanical action and water (sometimes with additives) physically remove the contaminants from the soil particles. Second, agitation of the soil particles allows the more highly contaminated fines to separate from the larger soil particles, thus reducing the volume of material requiring further treatment.

SOLVENT EXTRACTION operates on the principle that, in the correct solvent, organic contaminants can be solubilized preferentially and removed from the waste. The solvent used will vary, depending on the waste to be treated.

For **THERMAL DESORPTION**, the waste is heated in a controlled environment to cause organic compounds to volatilize from the waste. The operating temperature for thermal desorption is usually less than 1000°F (550°C). The volatilized contaminants usually require further control or treatment.

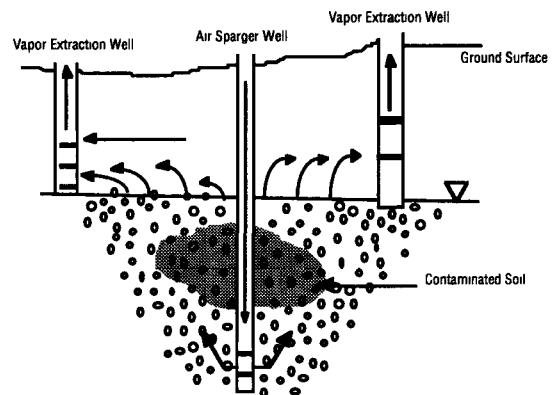

Groundwater Treatment Technologies

AIR SPARGING involves injecting air or oxygen into the aquifer to strip or flush volatile contaminants as the air bubbles up through the groundwater and is captured by a vapor extraction system. The entire system acts as an in situ air stripper. Stripped or volatilized contaminants usually will be extracted through soil vapor extraction wells and usually require further treatment.

Air sparging often is combined with **IN SITU GROUNDWATER BIOREMEDIATION**, in which nutrients or an oxygen source (such as air)

are pumped under pressure into the aquifer through wells to enhance biodegradation of contaminants in the groundwater.

Model of an Air Sparging System

DUAL-PHASE EXTRACTION extracts contaminants simultaneously from both the saturated and the unsaturated zone soils in situ. This new technology applies soil vapor extraction techniques to contaminants trapped in saturated zone soils, which are more difficult to treat than are those in the unsaturated zone. In some instances, this result may be achieved by sparging the groundwater section of a well that penetrates the groundwater table. Other methods also may be employed.

PASSIVE TREATMENT WALLS act like chemical slurry walls. Contaminated groundwater comes into contact with the barrier and a chemical reaction takes place. Limestone barriers, one type of treatment wall, increase the pH. The increase in pH effectively immobilizes dissolved metals in the saturated zone. Another type of passive treatment wall contains iron filings that dechlorinate chlorinated compounds.

IN SITU OXIDATION oxidizes contaminants that are dissolved in groundwater, converting them into insoluble compounds.

SURFACTANT FLUSHING of non-aqueous phase liquids (NAPL) increases the solubility and mobility of the contaminants in water, so that the NAPL can be biodegraded more easily in the aquifer or recovered for treatment aboveground via a pump-and-treat system.

OVERVIEW

Contents of this Report

The following sections contain summary information about and analysis of sites at which innovative treatment technologies are being or have been applied. Section 1: Superfund Remedial Actions covers all Superfund sites at which an innovative treatment technology is being or has been implemented under a remedial action. Such actions usually are documented in a ROD. Soil and groundwater technologies are discussed

separately. Section 2: Superfund Removal Actions provides information on Superfund removal action sites. Removals are conducted in response to an immediate threat caused by a release of a hazardous substance or substances. Section 3: Actions Under Other Federal Programs covers non-Superfund sites being addressed under RCRA and other federal programs.

SECTION I: SUPERFUND REMEDIAL ACTIONS

Overview of RODs

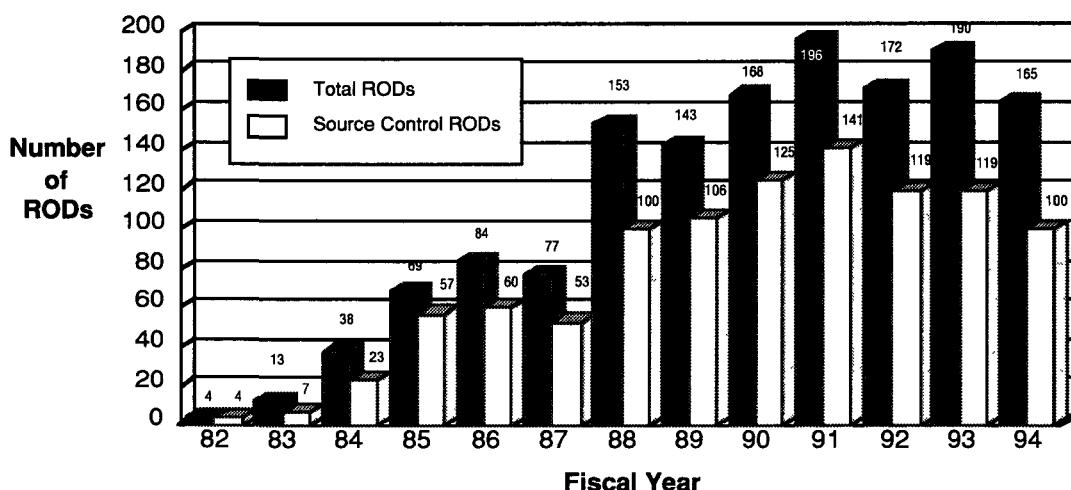

As of August 1995, there are 1,232 sites on the National Priorities List (NPL), excluding 82 sites deleted from the NPL. An additional 49 sites are proposed for the NPL. As of the end of FY 1994, 1,472 RODs (including ROD amendments) had been signed. Most RODs for remedial actions address the source of contamination, such as soil, sludge, sediments, and solid-matrix wastes. Such RODs are referred to

Source Control RODs

Source control RODs can be classified by the general type of technology selected: (1) RODs specifying some alternative treatment, (2) RODs specifying containment or disposal only, and (3) RODs specifying institutional controls or other actions (such as restrictions on land use, monitoring, or relocation of the affected community). Figure 2 shows the number of source control RODs that fall under each category. RODs in

Figure 1: Superfund Remedial Actions: RODs Signed by Fiscal Year

(Total Number of RODs = 1,472)

The difference between the total number of RODs and the number of source control RODs is the number of "groundwater treatment remedy" or "no action needed" RODs.

Source: USEPA Office of Emergency and Remedial Response

as "source control" RODs. In addition to the source, source control RODs may address remedial action required for groundwater. Other, non-source control RODs address groundwater only or specify that no action is necessary. Figure 1 shows the number of source control RODs compared with the total number of RODs for each fiscal year since 1982.

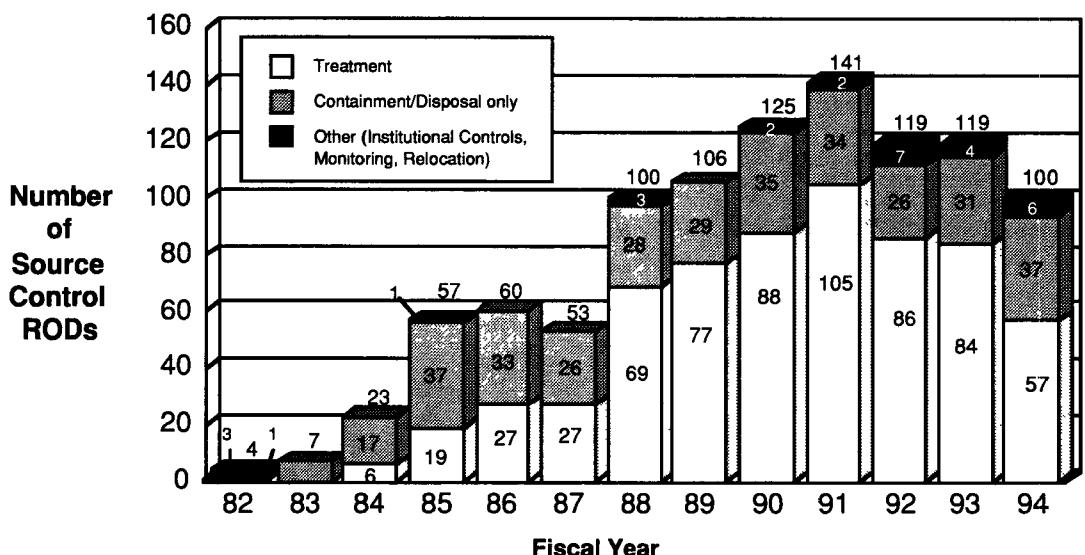

A total of 165 RODs (including ROD amendments) were signed in FY 1994, a decrease of 25 from the number signed in FY 1993. The number of source control RODs decreased by 19 during that year. However, the percentage of source control RODs relative to the total number of RODs remained the same from FY 1993 to FY 1994.

which some treatment is selected may include containment of treatment residues or waste from another part of the site. In FY 1994 there was an increase in the number of source control RODs that specify containment or disposal, compared with RODs under which some treatment of the source material was selected. Overall, for 64 percent of all source control RODs (from FY 1982 to FY 1994) at least one treatment technology for source control was selected (Figure 3).

The Superfund Amendments and Reauthorization Act of 1986 (SARA) required that EPA favor permanent remedies (that is, alternative treatment) over containment or disposal to remediate Superfund sites. From FY 1988 through

Source: USEPA Office of Emergency and Remedial Response

FY 1993, at least 69 percent of source control RODs provided provisions for treatment of wastes (Figure 4). The increase was most dramatic in FY 1988. In 49 percent of RODs signed in FY 1987, some treatment for source control was selected, while some treatment was selected in 69 percent of those RODs signed in FY 1988. However, the percentage in FY 1994 decreased to 57 percent. Figure 4 also illustrates the percentage of RODs in which at least one innovative technology was selected, as updated by current project status information. Of a total of 1,014 source control RODs signed through FY 1994, innovative technologies were selected and still are being considered or used under approximately 26 percent of RODs. Overall, innovative technologies have been selected at 22 percent of the 1,472 RODs signed since FY 1982.

Source Control Technologies

This section discusses the number and kinds of treatment technologies selected and used for source control in the Superfund remedial program. Most of the rest of the information in this section focuses on technologies, rather than RODs. In each ROD in which treatment was specified, more than one type of treatment technology may have been selected.

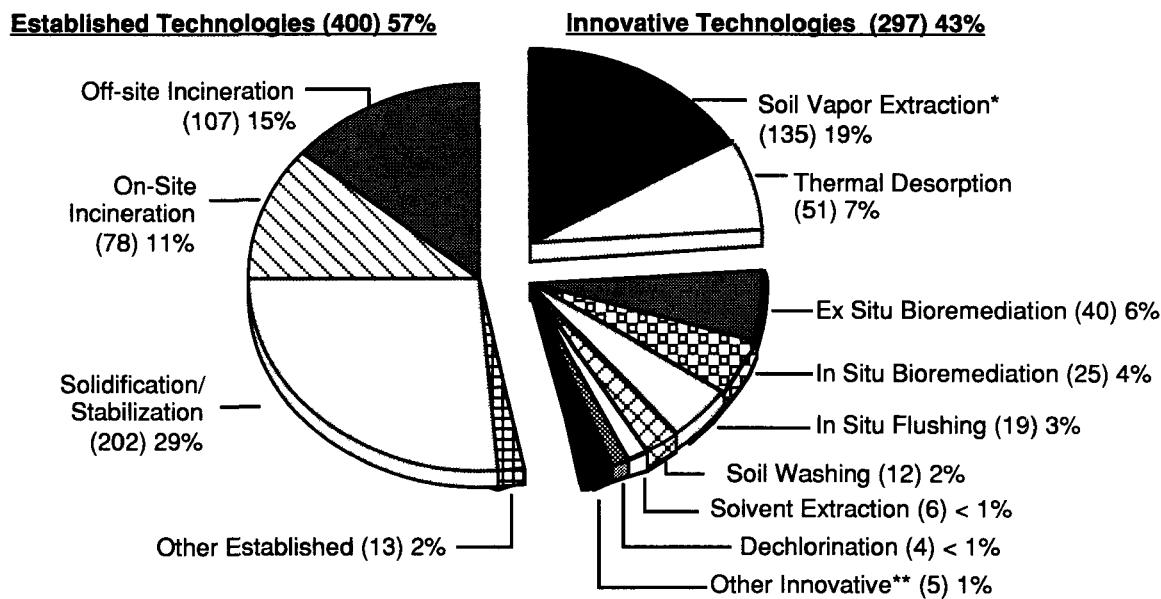

Figure 5 gives an overview of the established and innovative treatment technologies selected for

source control. Through FY 1994, a total of 697 treatment technologies were selected in 646 source control RODs specifying some treatment. The selection of multiple technologies results from the use of treatment trains or from the treatment of different wastes or areas of the site. Figure 5 illustrates that, through FY 1994, 43 percent of the 697 treatment technologies selected were innovative and 57 percent were established. Soil vapor extraction and thermal desorption are indicated as a separate wedge on Figure 5 because of the large number of applications of those two technologies. Appendix A provides data on the selection of the 697 source control treatment technologies by fiscal year.

Appendix B, the Innovative Technology Summary Matrix, lists each of the innovative and treatment technology projects for source control at remedial sites. (The summary matrix also includes innovative groundwater projects, removals, and non-Superfund projects that will be discussed in later sections.) Appendix C contains a matrix of established source control technologies. The *ITT Database* (see Notice) contains detailed information on specific sites at which innovative technologies are being implemented. Information on established treatment technologies is based on a review of RODs by OERR rather than interviews of Regional or state staff. Therefore, the only information provided for

() Number of times this technology was selected or used.

* Includes two dual-phase extraction projects also listed as in situ groundwater technologies.

** "Other" established technologies are soil aeration, open detonation, and chemical neutralization. "Other" innovative technologies are, phyto-treatment, contained recovery of oily wastes (CROW™), cyanide oxidation, in situ vitrification, and plasma high temperature metals recovery.

sites using established technologies is the name of the site and the year in which the ROD was signed. The list of sites does not reflect any changes in the remedy that may have occurred in the design phase of the cleanup and does not report the status of the projects.

Figure 6 compares the total number of established and innovative technologies for source control selected by fiscal year. The figure shows that more innovative technologies than established technologies were selected in RODs signed during FY 1993 and FY 1994. Figure 7 shows selection trends for the major established technologies, on-site and off-site incineration and solidification/stabilization. The number of sites implementing either on-site or off-site incineration decreased in FY 1994. Solidification/stabilization also decreased in FY 1994. Figure 8 graphically depicts, by fiscal year, the frequency of selection for the three most fre-

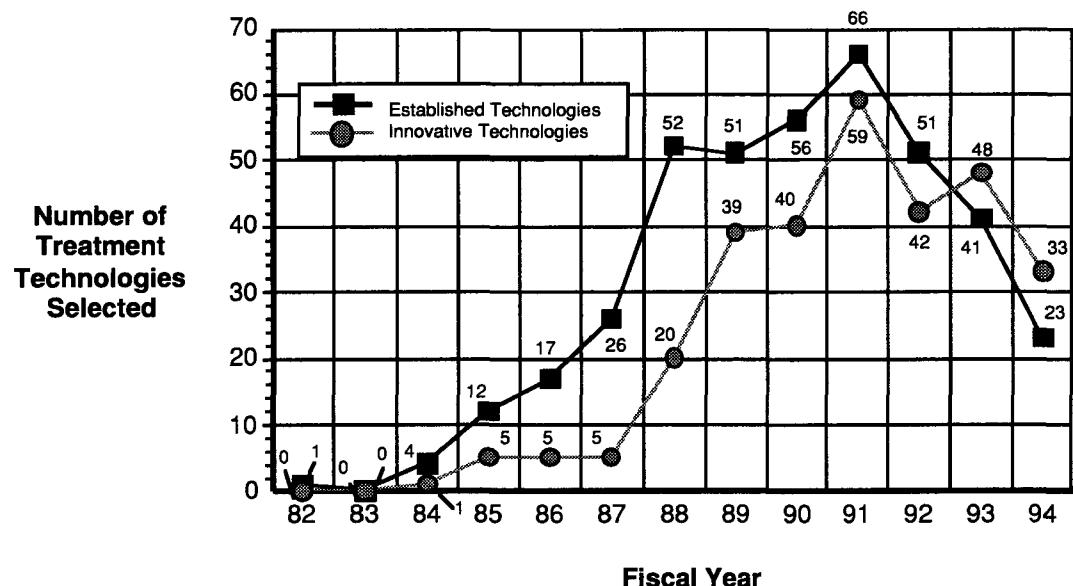

quently selected innovative treatment technologies, soil vapor extraction, thermal desorption, and bioremediation. These three technologies are discussed in more detail in later sections. Appendix A gives the number of established and innovative treatment technologies for both source control and groundwater by fiscal year.

Status of Innovative Treatment Technology Projects

An increasing number of innovative treatment technology projects are being implemented at remedial Superfund sites. In the past year, 51 additional innovative treatment technology projects have been implemented, and 15 projects have been completed including both source control and in situ groundwater. Appendix B gives the status of each project, and Figure 9 provides a summary of their status by technology type. The design of such projects typically takes one to three years. The *ITT Database*

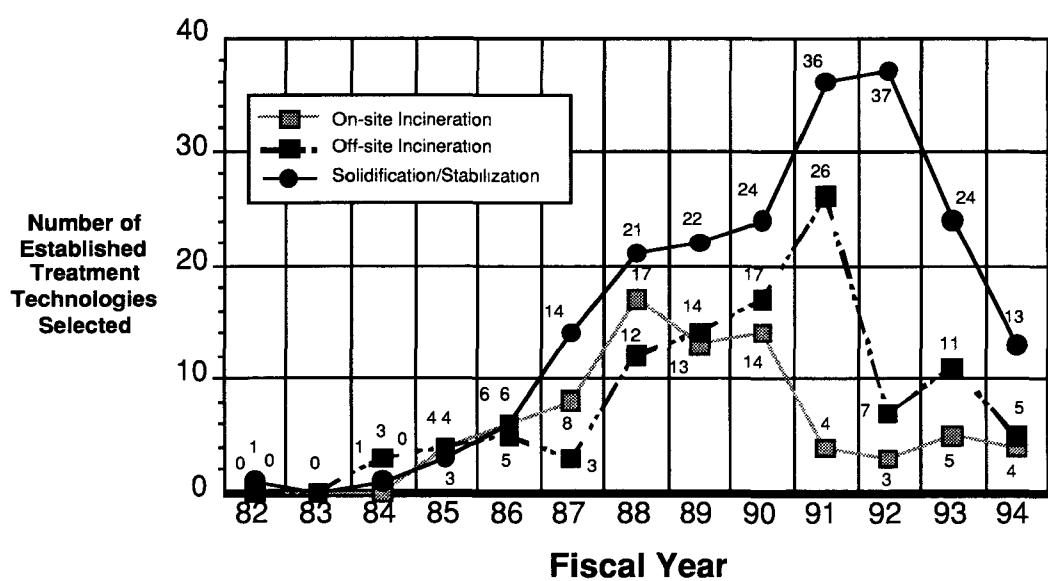

SECTION 1: SUPERFUND REMEDIAL ACTIONS

presents some brief performance and operating data on remedial, removal, and non-Superfund projects that have been completed. Data provided include periods of operation, typical pre- and post-treatment concentrations of key contaminants treated, cleanup goals, operating parameters (such as retention time and additives), materials handling required, and management of residuals.

Contaminants Addressed

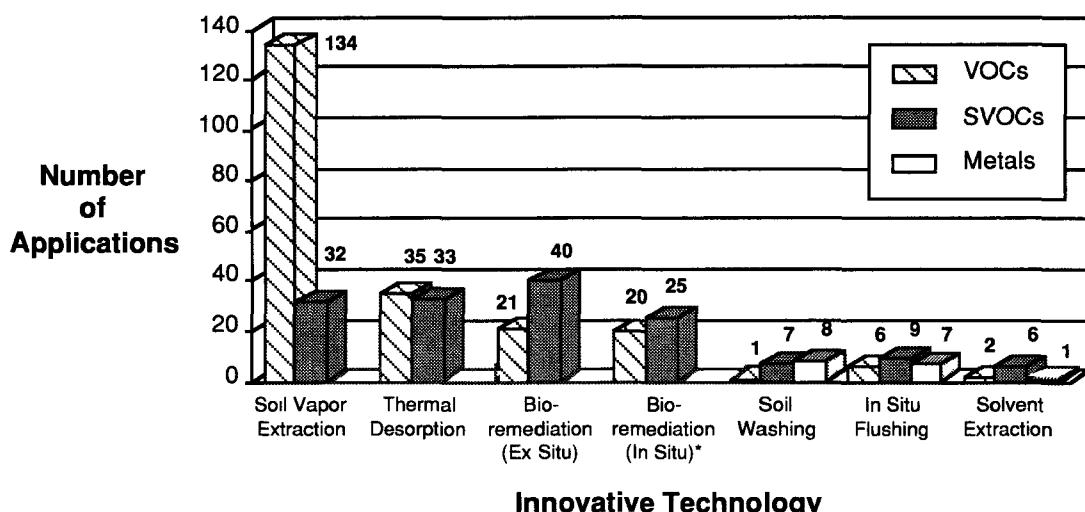

The data collected for this report form the basis for an analysis of the classes of contaminants treated by each technology type at remedial action sites. Figure 10 provides that information, by technology, for three major groups of contaminants: volatile organic compounds (VOC), semivolatile organic compounds (SVOC), and metals. For this report, compounds are categorized as VOCs or SVOCs, according to the

lists provided in EPA's SW-846 test methods 8240 and 8270, respectively. The *ITT Database* contains information about specific contaminants treated at each site at which an innovative technology has been or is being used.

Quantity of Soil Addressed

EPA analyzed the quantity of soil treated at 235 remedial action sites at which innovative treatment technologies have been or are being used, and for which data on the quantity of media treated were available (Figure 11). Not surprisingly, the tendency is to use in situ technologies to address larger quantities of soil, while ex situ technologies are used to treat smaller quantities. Because quantities for in situ projects cannot be accurately determined and many ex situ projects are not completed, the quantities in Figure 11 should be considered estimates.

Treatment Trains

Figure 12 compares the number of innovative technologies selected for both source control and in situ groundwater treatment with the number of RODs in which these technologies were selected. The graph shows that some sites use more than one innovative technology, often together in "treatment trains." Twenty-eight remedial sites use treatment trains for source control. Figure 13 identifies specific treatment trains used in remedial actions. Appendix D provides additional information on the sites that use treatment trains. Innovative treatment technologies may be used with established technologies or with other innovative technologies. The most common treatment train is soil washing followed by above-ground bioremediation (usually slurry-phase treatment). Technologies may be combined to reduce the volume of material that requires further treatment, as in the example given above; to prevent the emission of volatile contaminants during excavation and mixing; or to treat multiple contaminants in a single medium.

Soil Vapor Extraction

SVE is the most frequently selected innovative technology for treating soil. Currently 135 projects are being implemented. At some sites, several areas are being treated with SVE. Only 13 SVE remedial projects have been completed, but an additional 70 are underway. Duration varies from 1 month to 5 years or more. Most projects target chlorinated or nonchlorinated VOCs for

treatment; a few target semivolatiles, such as phenols and naphthalene. Most applications are vertical wells with activated carbon used to treat off-gases. Unusual applications include horizontal wells such as at the SMS Instruments site, New York.

Thermal Desorption

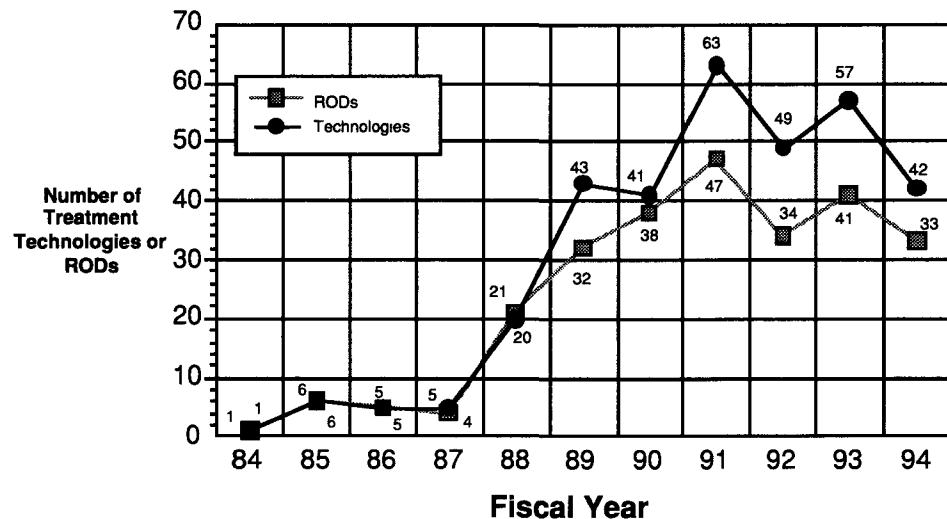

This technology has been selected 51 times. Seventeen projects are completed; another 13 are operating. Thermal desorption projects take less time to implement than soil vapor extraction: from 1 to 18 months for the 13 remedial projects completed thus far. Contaminants treated are shown in Figure 14. This technology is used to treat SVOCs, such as polychlorinated biphenyls (PCBs) and polynuclear aromatic hydrocarbons (PAHs), as well as VOCs.

Bioremediation

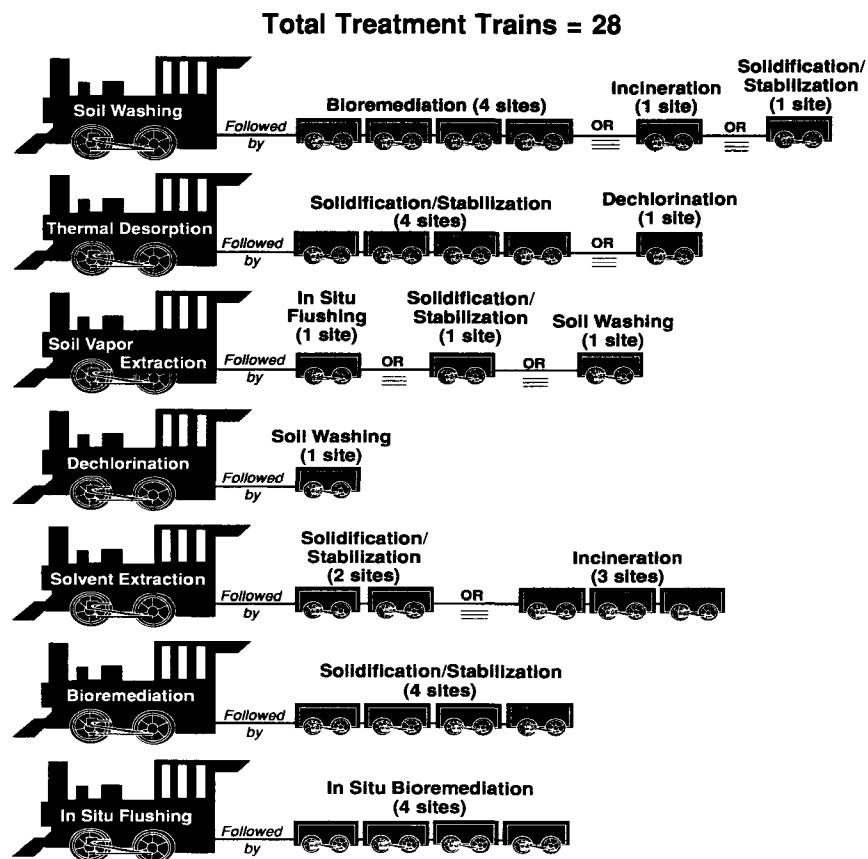

This technology has been selected a total of 65 times, but in a number of different forms. Figure 15 illustrates the different types of bioremediation being implemented. Land treatment is the most common form of ex situ bioremediation, followed by slurry-phase treatment. Bioventing has been specified for 7 of the 25 in situ soil bioremediation remedies, although bioventing approaches may be selected at additional projects as design proceeds. Contaminants treated by bioremediation are shown in Figure 16. The contaminants treated most often by

Treatment Trains with Innovative Treatment Technologies*

SECTION I: SUPERFUND REMEDIAL ACTIONS

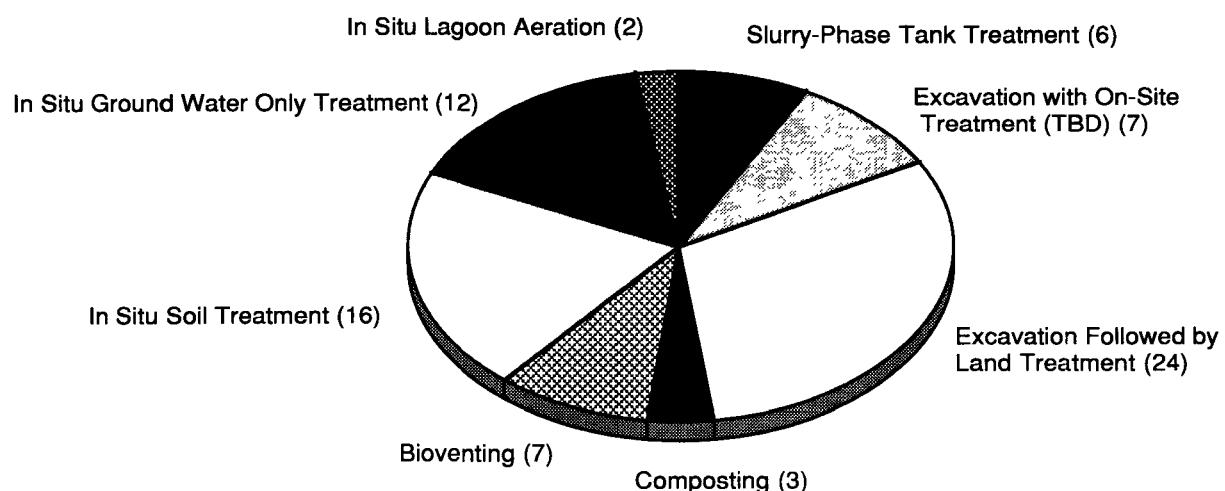

**Figure 14: Superfund Remedial Actions
Contaminants Treated by Thermal Desorption**

Note: At some sites, treatment is for more than one contaminant. Treatment may be planned, ongoing, or completed.

Source: Records of Decision (RODs) for fiscal years 1982 – 1994 and anticipated design and construction activities as of August 1995.

**Figure 15: Superfund Remedial Actions
Bioremediation Methods**

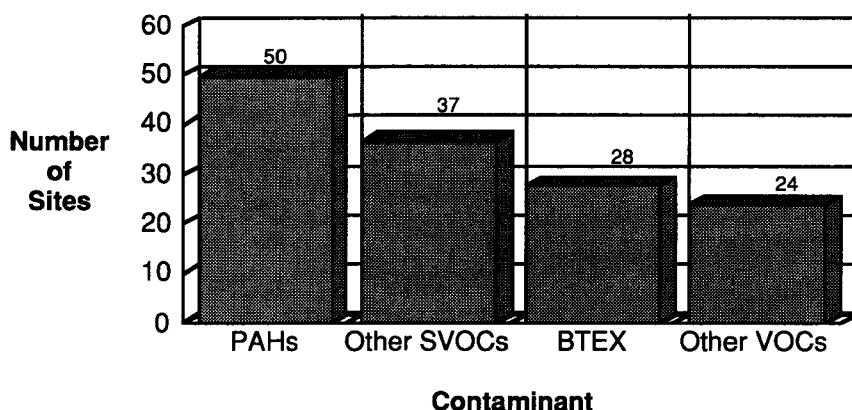

Note: Some RODs specify multiple remedies.

TBD: Specific treatment method to be determined.

Source: Records of Decision (RODs) for fiscal years 1982 – 1994 and anticipated design and construction activities as of August 1995.

SECTION 1: SUPERFUND REMEDIAL ACTIONS

**Figure 16: Superfund Remedial Actions
Contaminants Treated by Bioremediation***

*Includes *in situ* groundwater innovative treatment technologies.

Note: At some sites, treatment is for more than one contaminant. Treatment may be planned, ongoing, or completed.

Source: Records of Decision (RODs) for fiscal years 1982 – 1994 and anticipated design and construction activities as of August 1995.

bioremediation are PAHs. Benzene, toluene, ethylbenzene, and xylene (BTEX) compounds are the VOCs addressed most frequently; chlorinated VOCs are being treated at 5 sites.

Groundwater Remediation Technologies

Groundwater treatment remedies include pump-and-treat and *in situ* treatment or a combination of both. Figure 17 shows each type of groundwater treatment remedy selected. Groundwater remedies have been selected for 573 sites. Of these, 540 sites are implementing pump-and-treat systems alone. In the case of another 29 sites, pump-and-treat systems are being combined with *in situ* treat-

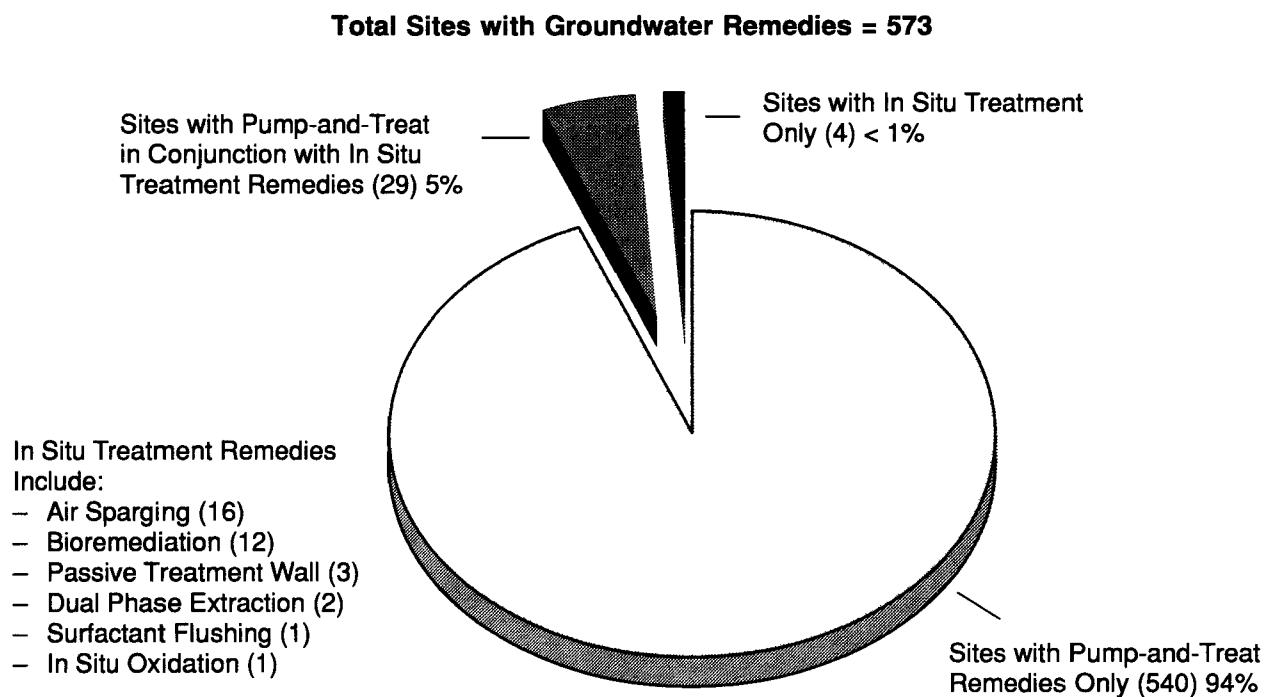

ment. Four sites have selected *in situ* treatment only to treat groundwater contamination.

EPA has selected *in situ* treatment of groundwater 35 times at 33 remedial sites. EPA selected *in situ* treatment of groundwater for nine remedial sites in FY 1994, including the first selection of surfactant flushing for dense NAPLs. Completion of *in situ* groundwater cleanup at Superfund sites is predicted to require 5 to 20 years. Figure 9 shows the overall status of *in situ* groundwater projects.

Appendix A gives the number of *in situ* groundwater treatment technologies selected each year. The summary matrix in Appendix B provides the site names, technologies, and project status.

Records of Decision (RODs) for fiscal years 1982 - 1994 and anticipated design and construction activities as of August 1995*

SECTION 2: SUPERFUND REMOVAL ACTIONS

A removal action under Superfund is conducted in response to an immediate threat caused by a release of a hazardous substance or substances. Removal action decisions are documented in an action memorandum. To date, innovative treatment technologies have been used in relatively few removal actions. The innovative technologies addressed in this report have been used 29 times in 26 removal actions (Figure 18). In addition, infrared incineration, no longer considered innovative, was used first at two removal actions. Since removal actions are responses to an immediate threat, and often involve smaller quantities of hazardous wastes than remedial activities, the implementation of the technology may progress faster at a removal site than at a remedial site. Figure 18 indicates that 90 percent

of removal projects that involve innovative treatment technologies have been completed.

Many removal actions involve small quantities of waste or immediate threats that require quick action to alleviate the hazard. Often, such activities do not lend themselves to on-site treatment. In addition, SARA does not establish the same preference for innovative treatment for removal it sets forth for remedial actions. However, EPA expects that innovative treatment technologies will be used more often in the future for larger and less time-critical removal actions.

The *ITT Database* provides more detailed information for each application of an innovative technology at a removal site. The summary matrix in Appendix B lists each removal site and innovative technology.

SECTION 3: ACTIONS UNDER OTHER FEDERAL PROGRAMS

This chapter contains available information on projects conducted under federal programs other than the Superfund program. Many of those projects are conducted at DoD and DOE facilities. The sites were identified through various sources of information, including discussions with DoD and DOE personnel. The RCRA corrective action sites using an innovative technology were identified through the review of 50 SBs, which are decision documents prepared for some actions at corrective action sites. Because

innovative technologies have likely been used at RCRA sites, but not documented in SBs, the list in this report should not be considered complete. Figure 19 summarizes the types of innovative treatment technologies and the number of projects, and indicates the status of each. The summary matrix in Appendix B lists the name of each site, the technology selected, and the status of the project. The *ITT Database* provides more information on each application.

Summary of Status Report Updates, Changes, and Deletions

Summary of Status Report Updates, Changes, and Deletions

Each edition of this report has contained new information on the applications of innovative technologies at Superfund sites and has updated the status of existing innovative projects. The information from records of decision (ROD) that was deleted or changed in each edition (from the first edition of the report, published in January 1991, through this seventh edition) is listed below to allow tracking of specific projects from edition to edition.

Additions, Changes, and Deletions, From the First Edition of the Report (January 1991) to the Second Edition (September 1991)

Region	Site Name/State (ROD Date)	Technology listed in 1st Edition	Added	Deleted	Changed to	Comments	Contact/Phone
3	Leetown Pesticides, WV (03/31/86)	Bioremediation		Yes		No further action. Risk was re-evaluated and it was determined that risk was not sufficient for remedial action.	Andy Palestini 215-597-1286 Philip Roitstein 215-597-9023
3	Harvey-Knott Drum, DE (09/30/85)	In situ soil flushing		Yes		During remedial design, sampling indicated VOCs were no longer present in the soils. Heavy metals remained at the surface. An ESD was issued in December 1992. Remedy will consist of capping the site.	Kate Lose 215-597-0910
2	SMS Instruments (Deer Park), NY (09/29/89)	Thermal desorption		Yes (changed to soil vapor extraction in third edition)		ROD was misinterpreted during ROD analysis.	Miko Fayon 212-264-4706
1	Re-Solve, MA (09/24/87)	Chemical treatment			Dechlorination	Reclassified technology.	Lorenzo Thantu 617-223-5500
2	GE Wiring Services, PR (09/30/88)	Chemical extraction			Soil washing	Reclassified technology.	Caroline Kwan 212-264-0151
6	Sol Lynn/Industrial Transformers, TX (03/25/88)	Chemical treatment			Dechlorination	Reclassified technology.	John Meyer 214-655-6735
10	Northwest Transformer, WA (09/15/89)	In situ vitrification		Yes		Technology dropped because commercial availability was delayed.	Christine Psyk 206-553-6519

Note: The second edition of the report also added information about 45 innovative treatment technologies selected for remedial actions in RODs signed during fiscal year (FY) 1990 and 18 innovative treatment technologies used in removal actions.

Additions, Changes, and Deletions, From the Second Edition of the Report (September 1991) to the Third Edition (April 1992)

Region	Site Name, State (ROD Date)	Technology (listed in 2d Edition)	Added	Deleted	Changed to	Comments	Contact/Phone
2	Marathon Battery, NY (09/30/88)	Thermal desorption		Yes		During design, soil gas concentration at hot spots was below state standards. Groundwater monitoring will continue.	Pam Tames 212-264-1036
2	Goose Farm, NJ (09/27/85)	In situ soil flushing		Yes		Incorrectly classified. A pump-and-treat system with reinjection of treated water is being used.	Laura Lombardo 212-264-6989
2	GE Wiring Services, PR (09/30/88)	Soil washing			Thermal desorption	Possible pre-wash of debris with surfactants	Caroline Kwan 212-264-0151
4	Coleman-Evans Wood Preserving, FL (09/26/90)	Soil washing		Yes		Problems due to the presence of furans; incineration is likely.	Tony Best 404-347-2643
5	Sangamo/Crab Orchard National Wildlife Refuge, IL (08/01/90)	In situ vitrification		Yes	Incineration	ROD specified the remedy as in situ vitrification or incineration; incineration was chosen.	Nan Gowda 312-353-9236
5	Anderson Development, MI (09/28/90)	In situ vitrification			Thermal desorption	Because of concern on the part of the community, the remedy was changed. A ROD amendment was signed on 9/30/91, and an ESD was signed on 10/2/92.	Jim Hahnenberg 312-353-4213
5	U.S. Avex, MI (09/07/88)	In situ flushing		Yes		Cleanup levels were reached by natural attenuation.	Robert Whippo 312-886-4759
6	Atchison/Santa Fe/Clovis, NM (09/23/88)	Bioremediation (ex situ)		Yes			Ky Nichols 214-655-6783
6	Crystal Chemical, TX (09/27/90)	In situ vitrification		Yes		Remedy was reconsidered after commercial availability of the technology was delayed. Vitrification was considered for hot spots only. Revised remedy will consist of capping and off-site disposal and consolidation of soils.	Lisa Price 214-655-6735

Note: The third edition of the report also added information about 70 innovative treatment technologies selected for remedial actions under FY 1991 RODs.

Additions, Changes, and Deletions, From the Second Edition of the Report (September 1991) to the Third Edition (April 1992) (continued)

Region	Site Name, State (ROD Date)	Technology Listed in 2nd Edition	3rd Edition		Comments	Contact/Phone
			Added	Deleted		
9	Solvent Service, CA (09/27/90)	Bioremediation (in situ)		Yes	ROD was misinterpreted during ROD analysis.	Kevin Graves 510-286-0435 Steve Morse (CA) 570-286-0304
9	Poly Carb, NV (Removal)	Bioremediation (ex situ)		Bioremediation (in situ)	Reclassified technology.	Bob Mandel 415-744-2290

Note: The third edition of the report also added information about 70 innovative treatment technologies selected for remedial actions under FY 1991 RODs.

Additions, Changes, and Deletions, From the Third Edition of the Report (April 1992) to the Fourth Edition (October 1992)

Region	Site Name, State (ROD Date)	Technology Listed in 3rd Edition		4th Edition		Comments	Contact/Phone
		Added	Dated	Changed to			
2	Lipari Landfill Marsh Sediment, NJ (07/11/88)	None	Thermal desorption			Missed during original ROD analysis.	Tom Graff 816-426-2296
2	GE Wiring Services, PR (09/30/88)	Thermal desorption		Soil washing			Caroline Kwan 212-264-0151
5	University of Minnesota, MN (06/11/90)	Thermal desorption		Yes	Incineration (in the fifth edition)	An ESD was issued in August 1991 to change remedy to thermal desorption <i>or</i> incineration. Incineration was chosen because it was the less expensive of the two.	Darrel Owens 312-886-7089
6	Sol Lynn/Industrial Dechlorination Transformers, TX (03/25/88)	Dechlorination		Yes		Discontinued because of difficulties in implementation.	John Meyer 214-655-6735
6	Koppers/Texarkana, TX (09/23/88)	Soil washing	In situ flushing			Remedy added by ROD amendment.	Ursula Lennox 214-655-6735
9	Poly Carb, NV (Removal)	Bioremediation (in situ)			Bioremediation (ex situ)	Reclassified technology.	Bob Mandel 415-744-2290
9	Teledyne Semiconductors, CA (03/22/91)	Soil vapor extraction		Yes		Mistakenly deleted from report.	Sean Hogan 415-744-2233
10	Gould Battery, OR (03/31/88)	Soil washing	Soil washing			Missed during original ROD analysis.	Chip Humphries 503-326-2678

Note: The fourth edition of the report also added information about 10 innovative treatment technologies selected for remedial action under FY 1992 RODs and 21 innovative treatment technologies implemented at non-Superfund sites.

Additions, Changes, and Deletions, From the Fourth Edition of the Report (October 1992) to the Fifth Edition (September 1993)

Region	Site Name, State (ROD Date)	Technology Listed in 4th Edition	5th Edition	Comments	Contact/Phone
			Added Deleted	Changed to	
1	Re-Solve, MA (09/24/87)	Dechlorination	Yes	Pilot study showed that dechlorination increased the volume and that the waste still required incineration. An ESD to incinerate residuals off site is in peer review.	Joe Lemay 617-573-9622
1	Pinette's Salvage Yard, ME (05/30/89)	Solvent extraction	Yes	Will incinerate off site.	Ross Gillett 617-573-5766
2	Naval Air Warfare Center, OU 1, NJ (02/04/91)	In situ flushing	Yes	Remedy involves pump-and-treat system, with on-site discharge. Soil is not being targeted.	Jeff Gratz 212-264-6667
2	Naval Air Warfare Center, OU 2, NJ (02/04/91)	In situ flushing	Yes	Remedy involves pump-and-treat system, with on-site discharge. Soil is not being targeted.	Jeff Gratz 212-264-6667
2	Naval Air Warfare Center, OU 4, NJ (02/04/91)	In situ flushing	Yes	Remedy involves pump-and-treat system, with on-site discharge. Soil is not being targeted.	Jeff Gratz 212-264-6667
2	Caldwell Trucking, NJ (09/25/86)	Thermal desorption	Yes	Thermal desorption is not necessary because highly contaminated soil will be incinerated off site. Remainder of soil will be stabilized. ESD issued.	Ed Finnerty 212-264-3555
3	Tobyhanna Army Depot, PA (Non-Superfund project)	Bioremediation (in situ)	Yes	Will conduct ex situ passive volatilization.	Drew Lausch 215-597-3161 Ross Manitone (Tobyhanna) 717-894-6494

Note: The fifth edition of the report also added information about 49 innovative treatment technologies selected for remedial actions under FY 1992 RODs and 15 innovative treatment technologies used in removal actions.

Additions, Changes, and Deletions, From the Fourth Edition of the Report (October 1992) to the Fifth Edition (September 1993) (continued)

Region	Site Name, State (ROD date)	Technology Listed in 4th Edition	5th Edition			Comments	Contact/Phone
			Added	Deleted	Changed to		
4	Smith's Farm Brooks, KY (09/30/91)	Dechlorination	Thermal desorption			Will alter chemistry to achieve dechlorination during thermal desorption.	Tony DeAngelo 404-347-7791
4	American Creosote Works, FL (09/28/89)	Soil washing		Yes		Bench-scale study of soil washing showed that the concentrations of carcinogenic PAHs were not reduced adequately. Dioxins also were discovered at much higher concentrations.	Mark Fite 404-347-2643
4	American Creosote Works, FL (09/28/89)	Bioremediation (ex situ)		Yes		Bench-scale study of bioremediation (ex situ) showed that the concentrations of carcinogenic PAHs were not reduced adequately. Dioxins also were discovered at much higher concentrations.	Mark Fite 404-347-2643
4	Hollingsworth Solderless, FL (04/10/86)	None	Soil vapor extraction			Listed as soil aeration in the third edition.	John Zimmerman 404-347-2643
5	Cliffs/Dow Dump, MI (09/27/89)	Bioremediation (in situ)		Yes		Bioremediation (in situ) was a misinterpretation of the ROD. All soil will be excavated and treated by bioremediation (ex situ).	Ken Glatz 312-886-1434
6	Tenth Street Dump/Junkyard, OK (09/27/90)	Dechlorination		Yes		Remedy has been suspended because of difficulties in implementation and escalating cost; Actual cost was double the cost projected in ROD. ROD amendment to cap in place, is being issued.	Mike Overbay 214-655-8512

Note: The fifth edition of the report also added information about 49 innovative treatment technologies selected for remedial actions under FY 1992 RODs and 15 innovative treatment technologies used in removal actions.

Additions, Changes, and Deletions, From the Fourth Edition of the Report (October 1992) to the Fifth Edition (September 1993) (continued)

Region	Site Name, State (RON Date)	Technology Listed in 4th Edition	Added	Deleted	Changed to	Comments	Contacts/Phone
7	Fairfield Coal & Gas, IA (09/21/90)	Bioremediation (in situ)		Yes		Pilot study showed in situ bioremediation was too costly. It appears that the present pump-and-treat system will achieve cleanup levels.	Bruce Morrison 913-551-7755
8	Sand Creek Industrial OU 5, CO (09/28/90)	Soil washing			Thermal desorption	Soil washing did not meet performance standards and was expensive. ROD amendment was issued in early September 1993.	Erma Acheson 303-294-1971
9	Koppers Company (Oroville), CA (04/04/90)	Bioremediation (ex situ)		Yes		Misinterpretation of ROD during ROD analysis.	Fred Schlauffer 415-744-2365
9	Signetics (AMD 901) TRW OU, CA (09/11/91)	None		Soil vapor extraction		Remedy added.	Joe Healy 415-744-2331 Kevin Graves (CA) 510-286-0435
9	Teledyne Semiconductors, CA (09/30/91)	None		Soil vapor extraction		Dropped by mistake from fourth edition.	Sean Hogan 415-744-2233
10	IDEL Warm Waste Pond, ID (12/05/91)	Acid extraction		Yes		Treatability study of acid extraction did not achieve good extraction rates. Did not reduce the volume of waste. Will excavate, consolidate, and cap.	Linda Meyer 206-553-6636 Nolan Jenson (DOE) 208-526-0436
10	IDEL Warm Waste Pond, ID (12/05/93)	Soil washing		Yes		Treatability study of soil washing did not achieve acceptable results. Did not reduce the volume of waste. Will excavate, consolidate, and cap.	Linda Meyer 206-553-6636 Nolan Jenson (DOE) 208-526-0436

Note: The fifth edition of the report also added information about 49 innovative treatment technologies selected for remedial actions under FY 1992 RODs and 15 innovative treatment technologies used in removal actions.

Additions, Changes, and Deletions, From the Fifth Edition of the Report (September 1993) to the Sixth Edition (September 1994)

Reason	Site Name, State (ROD Date)	Technology Listed in 5th Edition	6th Edition			Comments	Contacts/Phone
			Added	Deleted	Changed to		
1	Union Chemical Co., OU 1, ME (12/27/90)	Thermal desorption			Soil vapor extraction	It was determined that SVE would be the more cost-effective of the two. ESD was signed April 1994.	Terry Connelly 617-573-9638 Christopher Rushton (ME DEP) 207-287-2651
1	Tibbets Road, NH (09/29/92)	In situ soil flushing		Yes		Misinterpretation of ROD during ROD analysis. Soil was not targeted for treatment.	Darryl Luce 617-573-5767 Mike Robinette (NH) 603-271-2014
2	Ewan Property, OU2, NJ (09/29/89)	Soil washing and solvent extraction		Yes		Reevaluation of site found significantly less contaminated soil than originally had been estimated. Soil will be disposed of off site. ESD was signed July 1994.	Kim O'Connell 212-264-8127 (temporary)
2	Naval Air Engineering Center, OU 7, Interim Action, NJ (03/16/92)	In situ flushing		Yes		Misinterpretation of the ROD during ROD analysis.	Jeff Gratz 212-264-6667 Robert Wing 212-264-8670
2	Solvent Savers, NY (09/30/90)	Soil vapor extraction		Yes		Soil vapor extraction is a secondary remedy that may be used instead of thermal desorption, the primary remedy, if treatability studies show it to be effective.	Lisa Wong 212-264-9348
3	U.S. Titanium, VA (11/21/89)	In situ flushing			Neutralization with lime (ex situ)	Treatability studies indicated that the technology was not feasible. ESD is under preparation.	Vance Evans 215-597-8485 Jeff Howard (VA) 804-752-4203

Note: The sixth edition of the report also added information about 53 innovative treatment technologies selected for remedial actions in FY 1993 RODs.

Additions, Changes, and Deletions, From the Fifth Edition of the Report (September 1993) to the Sixth Edition (September 1994) (continued)

Region	Site Name, State (ROD Date)	Technology Listed in 5th Edition	6th Edition			Comments	Contact/Phone
			Added	Deleted	Changed to		
3	L.A. Clarke & Sons, OU 1 (Soils), VA (03/31/88)	Bioremediation (in situ)		Yes		Facility is no longer in operation, and excavation can be done. Remedies being considered include thermal desorption.	Andy Palestini 215-597-1286
3	L.A. Clarke & Sons, OU 1 (Soils), VA (03/31/88)	In situ flushing		Yes		Facility is no longer in operation, and remedies being considered include thermal desorption.	Andy Palestini 215-597-1286
3	L.A. Clarke & Sons, Lagoon Sludge OU, VA (03/31/88)	Bioremediation (ex situ)			Reuse off site as fuel	Technology changed because of uncertainty about the ability of bioremediation to reach treatment goals. ESD was signed on 3/94.	Andy Palestini 215-597-1286
3	Henderson Road, PA (06/30/88)	Soil vapor extraction		Yes		Conducted air injection only to facilitate pump-and-treat system. Vapors were not extracted. Further investigation revealed that the vadose zone was not an area of concern.	Joe McDowell 215-597-8240
4	Cabot Carbon/Koppers (Groundwater), FL (09/27/90)	Bioremediation (in situ groundwater)		Yes		Groundwater is not being treated; only soil is being treated.	Patsy Goldberg 404-347-6265
4	Benfield Industries, NC (07/31/92)	Soil washing and bioremediation (slurry phase)			Land treatment	Land treatment was determined to be a more cost-effective technology.	Jon Bornholm 404-347-7791
4	Charles Macon Lagoon, Lagoon #10, NC (09/31/91)	Bioremediation (ex situ)		Yes		Treatability study indicated that the technology could not treat the contaminants of concern because of materials problems. Will excavate and dispose of wastes off site. ROD amendment was signed in 3/94.	Geizelle Bennett 404-347-7791 David Lown (NC) 919-733-2801

Note: The sixth edition of the report also added information about 53 innovative treatment technologies selected for remedial actions in FY 1993 RODs.

Additions, Changes, and Deletions, From the Fifth Edition of the Report (September 1993) to the Sixth Edition (September 1994) (continued)

Region	Site Name, State (ROD Date)	Technology Listed in 5th Edition	6th Edition			Comments	Contact/Phone
			Added	Deleted	Changed to		
4	Palmetto Wood Preserving, SC (09/30/87)	Chemical treatment		Yes		Waste will be disposed of more cost-effectively off site.	Al Cherry (404) 342-7791
4	Arlington Blending & Packaging Co., OU1, TN (06/28/91)	Dechlorination		Yes		Another disposal method is likely to be used.	Derek Matory 404-347-7791
5	South Andover Salvage Yard, OU 2, MN (12/24/91)	Bioremediation (ex situ)		Yes	Thermal treatment	Technology changed to off-site thermal treatment (either thermal desorption or incineration) because of reduced volume of contamination found during RD investigations. ROD amendment was signed 5/31/94.	Bruce Sygniewski 312-886-6189
5	Allied Chem & Ironton Coke, OU 2, OH (12/28/90)	Bioremediation (in situ)				Adding technology to treat more highly contaminated soil.	Tom Alcamo 312-886-7278
5	Allied Chem & Ironton Coke, OU 2, OH (12/28/90)	Bioremediation (in situ)				Adding technology to treat more highly contaminated soil.	Tom Alcamo 312-886-7278
5	United Scrap Lead/SIA, OH (09/30/88)	Soil washing		Yes		Determined to be too expensive. Other alternatives being evaluated. ROD amendment planned.	Anita Boseman 312-886-6941 Timothy Hull (OH) 513-285-6357
5	MacGillis and Gibbs Co./Bell Lumber and Pole Co., MN (12/31/92)	Soil washing and Bioremediation (ex situ) of fines		Yes	Incineration on site	Incineration was contingency remedy in ROD. State had concerns about effective means of soil washing, and cost of incineration has decreased. ESD will be signed in fall 1994.	Daryl Owens 312-886-7089

Note: The sixth edition of the report also added information about 53 innovative treatment technologies selected for remedial actions in FY 1993 RODs.

Additions, Changes, and Deletions, From the Fifth Edition of the Report (September 1993) to the Sixth Edition (September 1994) (continued)

Region	Site Name, State (ROD Date)	Technology Listed in 5th Edition	Added	Deleted	Changed to	Comments	Contact/Phone
6	Fruitland Drum, NM (09/08/90)	Dechlorination			Incineration (off site)	Dechlorination is not being pursued because of cost considerations.	Gregory Fife 214-655-6773
6	Holloman AFB, Main POL Area, NM	Bioremediation (in situ) (groundwater)		Yes		Groundwater remediation is not planned for this area.	Ron Stirling (USACE) 402-221-7664
6	Holloman AFB, Main POL Area, NM	Air sparging		Yes		Groundwater remediation is not planned for this area.	Ron Stirling (USACE) 402-221-7664
6	South Valley, NM (09/30/88)	Soil vapor extraction		Yes		Determined there was insignificant concentration to warrant remediation. No further action.	Bert Gorrod 214-655-6779
6	Tinker AFB (Soldier Creek Bldg. 3001), OK (08/16/90)	Soil vapor extraction		Yes		Determined that SVE was not viable. No alternative has been selected.	Susan Webster 214-655-6784 Major Richard Ashworth (USAF) 405-734-3058
8	Rocky Mountain Arsenal, M-1 Basins (OU 16), CO (02/26/90)	In situ vitrification		Yes		Remedy has been canceled because of problems with the contractor. New ROD is being negotiated.	Connally Mears 303-293-1528
8	Portland Cement Co. (Kiln Dust No. 2 and No. 3) OU2, UT (03/31/92)	Chemical treatment		Yes		Technology is not considered innovative.	Mike McCeney 303-293-1526
9	Mesa Area Ground Water Contamination, AZ (09/27/91)	Soil vapor extraction		Yes		Site has been removed from National Priorities List (NPL), referred to the state	Maurice Chait 602-962-2187 Richard Oln 602-207-4176

Note: The sixth edition of the report also added information about 53 innovative treatment technologies selected for remedial actions in FY 1993 RODs.

Additions, Changes, and Deletions, From the Fifth Edition of the Report (September 1993) to the Sixth Edition (September 1994) (continued)

Resigion	Site Name, State (ROD Date)	Technology Listed in 5th Edition	Added	Deleted	Changed to	Comments	Contact(s)/Phone
9	Castle Air Force Base, OU 1, CA (09/30/91)	Bioremediation (in situ groundwater)		Yes	Pump and treat with air stripping	Bench-scale test indicated that the technology did not work. No ESD or ROD amendment is being issued.	David Roberts 415-744-1487 Brad Hicks (USAF) 209-726-4841
9	Teledyne Semiconductors, CA (03/22/91)	Soil vapor extraction		Yes		ROD was misinterpreted. SVE was intended only for Spectra Physics, the adjacent site.	Sean Hogan 415-744-2233 Carla Dube 510-286-1041
9	FMC (Fresno), CA (06/28/91)	Soil washing		Yes		Soil washing did not work because the soil contained too many fines. Thermal desorption and solidification and stabilization are being considered as possible remedies.	Tom Dunkelman 415-744-2287 Mike Pfister (CA) 209-297-3934
9	Signetics (Advanced Micro Devices 901), CA (09/11/91)	Soil vapor extraction		Yes		Site is subject to a combined ROD for Signetics, AMD 901/902 and TRW Microwave site. SVE is not being done at the TRW OU. ROD was misinterpreted.	Darrin Swartz-Larson 415-744-2233 Kevin Graves (CA) 510-286-0435
9	Sacramento Army Depot, Oxidation Lagoons OU, CA (09/30/92)	Soil washing		Yes		Technology canceled because of cost; solidification is being considered as an alternative.	Marlin Mezquita 415-744-2393 George Siller (USACE) 916-537-7418 Dan Oburn (Sacramento Army Depot) 916-388-4344
10	McChord AFB Washrack Treatment Area, AK (09/28/92)	Bioremediation (ex situ)			Yes	Additional studies showed that treatment is not needed.	Marie Jennings 206-553-1173

Note: The sixth edition of the report also added information about 53 innovative treatment technologies selected for remedial actions in FY 1993 RODs.

Additions, Changes, and Deletions, From the Sixth Edition of the Report (September 1994) to the Seventh Edition (September 1995)

Region	Site Name, State (ROD Date)	Technology Listed in 6th edition	7th edition			Comments	Contact/Phone
			Added	Deleted	Changed to		
1	Linemaster Switch Corporation, CT (07/21/93)	Soil vapor extraction			Dual phase extraction	Groundwater also is being treated with this technology	Elise Jakabhaazy 617-573-5760
2	American Thermostat, NY (06/27/90)	Thermal desorption	Thermal Desorption (phase 2)			Project is being conducted in two phases. Phase 1 has been completed and is listed as a separate project.	Christo Tsiamis 212-637-4257
2	GCL Tie and Treating, NY (Removal Action)	Composting			Thermal desorption (being implemented as a remedial action with the ROD signed 09/30/94)	Site is not amenable to composting because of the presence of long-chain PAHs and the time constraints of the removal process. A treatability study achieved over 90% reduction but little degradation of long chain carcinogenic hydrocarbons occurred.	Joe Cosentino 908-906-6983
2	General Motors Central Foundry Division (OU 1 and OU 2), NY (12/17/90) & (03/31/92)	Bioremediation (slurry phase)			Thermal desorption	Both OUs were combined under the thermal desorption remedy. ROD amended to combine both OUs under a thermal desorption remedy.	Lisa Jackson 212-637-4274
2	Pasley Solvents and Chemicals, Inc., NY (02/24/92)	Soil flushing and soil vapor extraction	Air sparging		Soil vapor extraction and air sparging	SVE, in combination with air sparging, will eliminate the need for soil flushing. ROD amendment was signed 05/22/95.	Sherrel Henry 212-637-4273

Note: The seventh edition of the report also adds information about 42 innovative treatment technologies selected for remedial actions in FY 1994 RODs and 8 innovative treatment technologies selected for 7 RCRA corrective actions.

Additions, Changes, and Deletions, From the Sixth Edition of the Report (September 1994) to the Seventh Edition (September 1995)
 (continued)

Region	Site Name, State (ROD Date)	Technology Listed in 6th edition	Added	Deleted	Changed to	Comments	Contact/Phone
3	Bendix, PA (09/30/88)	Soil vapor extraction		Yes		It was determined that SVE was not a viable remedy; soil was too tightly compacted. No alternative has been selected.	Jim Harper 215-597-6906
3	Brown's Battery Breaking Site, OU 2, PA (07/02/92)	Fuming gasification			Plasma high-temperature metals recovery	The name of the technology was changed to reflect more accurately the treatment process.	Richard Watman 215-597-8996
4	Helena Chemical, SC (09/08/93)	Bioremediation (ex situ) and dechlorination		Yes		Technology could not meet cleanup goal; will incinerate off site.	Bernie Hayes 404-347-7791 ext-2048
5	Carter Industries, MI (09/18/91)	Thermal desorption		Yes		Thermal desorption was too costly (~ \$300/yd ³). It is less expensive to dispose of the wastes at TSCA landfill (~ \$186/ton).	Jon Peterson 312-353-1264
5	Cliffs/Dow Dump, MI (09/27/89)	Bioremediation (ex situ)		Yes		Remedy could not reduce concentrations of benzo(a)pyrene to acceptable level. Contaminated soil was excavated and placed in a permitted landfill.	Ken Glatz 312-886-1434
5	Electro-Voice, OU 1, MI (06/23/92)	Soil vapor extraction	Air sparging			Technology actually is a combination of SVE and air sparging called the Subsurface Volatilization and Ventilation System™.	Eugenia Chow 312-353-3156

Note: The seventh edition of the report also adds information about 42 innovative treatment technologies selected for remedial actions in FY 1994 RODs and 8 innovative treatment technologies selected for 7 RCRA corrective actions.

Additions, Changes, and Deletions, From the Sixth Edition of the Report (September 1994) to the Seventh Edition (September 1995)
 (continued)

Region	Site Name, State (RON Date)	Technology Listed in 6th edition	Added	7th edition	Comments	Changed to	Contact Person
5	Ionia City Landfill, MI (09/29/89)	Vitrification (in situ)		Yes	Remedy was canceled. Conditions at the site had changed since 1989. Project was implemented as a time critical removal action.		Michael Gifford 312-886-7257
5	Seymour Recycling, IN (09/30/87)	Bioremediation (in situ groundwater)		Yes	Bioremediation of groundwater was not actively pursued. Contamination degraded through natural attenuation.		Jeff Gore 312-886-6552
5	Verona Well Field OU 2, MI (06/28/91)	Soil vapor extraction		Soil vapor extraction	Conducting soil vapor extraction at two separate sites under this ROD: Annex area and Paint shop area. Projects are listed as separate entries in the ASR seventh edition.		Janice Bartlett 312-886-5438
5	Wayne Reclamation and Recycling, IN (03/30/90)	Soil vapor extraction		Air sparging	Air sparging was added under the existing ROD to treat groundwater.		Duane Heaton 312-886-6399
6	Koppers/Texarkana, TX (09/23/88)	Soil washing		Yes	Volume of soil was not as large as originally had been projected. The small volume did not warrant bringing a soil washing unit on site. Will excavate and dispose of soil off site.		Ursula Lennox 214-665-6743

Note: The seventh edition of the report also adds information about 42 innovative treatment technologies selected for remedial actions in FY 1994
 RODs and 8 innovative treatment technologies selected for 7 RCRA corrective actions.

6	Koppers/Texarkana, TX (09/23/88)	In situ flushing		Yes			In situ flushing was never intended as a treatment at the site. Misinterpretation of the ROD during ROD analysis.	Ursula Lennox 214-665-6743
8	Chemical Sales Company (OU 1), CO (06/27/91)	Soil vapor extraction	Air sparging				Air sparging was added under the existing ROD to treat groundwater.	Armando Saenz 303-293-1532
8	Mouat Industries, MT (Removal Action)	Chemical treatment		Yes			Reducing chromium VI to chromium III not considered innovative.	Ron Bertran 406-449-5720
9	Phoenix-Goodyear Airport Area (North and South Facilities), AZ (09/26/89)	Soil vapor extraction	Soil vapor extraction				Site is divided into 2 areas: North area & South area. Each area is listed as an individual project in the seventh edition ASR.	Craig Cooper 415-744-2370 Rusty Harris-Bishop 415-744-2365 Nancy Moore (AZ) 602-207-4180
9	Fairchild Semiconductor, CA (6/30/89)	2 listings for soil vapor extraction	3 more SVE projects				Soil vapor extraction systems are being implemented at 5 different areas at the site.	Elizabeth Adams 415-744-2235
9	Indian Bend Wash, AZ (09/27/93)	Soil vapor extraction	4 distinct areas using soil vapor extraction				SVE is being conducted at four distinct areas; areas 6, 7, 8, and 12, at the site. Each site is considered as an individual project.	Emily Roth 415-744-2247
9	Intersil, CA (9/27/90)	Soil vapor extraction					Site renamed to Intersil/Siemens (Intersil)	Belinda Wei 415-744-2280

Note: The seventh edition of the report also adds information about 42 innovative treatment technologies selected for remedial actions in FY 1994 RODs and 8 innovative treatment technologies selected for 7 RCRA corrective actions.

9	Solvent Service, CA (09/27/93)	Soil vapor extraction			Soil vapor extraction under RCRA corrective action	Project was changed from a Superfund remedial action to a RCRA corrective action.	Tony Mancini 510-286-0825
10	Fairchild AFB Priority 1 OUS (OU 1) Craig Rd Landfill, WA (02/13/93)	Soil vapor extraction		Yes		Remedy was not implemented because of the following concerns: <ul style="list-style-type: none"> • Generation of combustible gases • Heterogeneous stratigraphy • Reluctance to put holes into the landfill, which could lead to leaching of contaminants Will cap the landfill and conduct pump-and-treat operations.	Cami Grandinetti 206-553-8696
10	Gould, Inc., OR (03/31/88)	Soil washing		Yes		Remedy was shown to be ineffective due to varying site conditions and problems with the technology.	Chip Humphries 503-326-2678
10	Naval Submarine Base, Bangor Site A, OU 1, WA (12/06/91)	Soil washing			Soil flushing (ex situ)	Will excavate and place soil in a lined pit. Soil will be sprayed with water and leachate and will be collected and treated.	Harry Craig 503-326-3250 Craig Thompson (WA) 360-407-7234 Chris Drury (Navy) 360-396-0062
